

FINALLY THE WAIT IS OVER

With IDABUS, there is finally a cloud successor to Microsoft Identity Manager (MIM Portal). Identity Management enables the individual implementation of different company requirements. With IDABUS, it is possible to manage your company's users and data, synchronize them with other systems and map various company processes. With IDABUS, central access control is implemented by automatically controlling access to required data and applications.

FEATURES & COMPONENTS

Performance

The performance of the IDABUS Identity Solution is dynamically scalable to better compensate for workload peaks.

Security

IDABUS uses all available security mechanisms of Microsoft Azure.

Support

An experienced 24/7 helpdesk is available for the IDABUS Identity Solution in English and German.

Self-service user interface

Through the customizable user interface, users are provided with an individual view in the IDABUS portal. It is also possible to request authorizations and group memberships as a self-service.

Authentication

IDABUS uses Microsoft Entra AAD for authentication at the Identity Portal. This enables MFA and Single Sign On.

Migration

IDABUS Identity Solution is able to convert both identity data and system configurations such as workflows and internal authorizations. This minimizes the cost of the migration project and preserves the often significant investment in the MIM environment.

Object history

Rewind time and view the state of any entities in the past, including those that have already been deleted, and restore them if necessary.

RBAC

The IDABUS-RBAC integration enables automated access and authorization control and can be provisioned into various connected systems.

Efficiency improvement

Workflows for onboarding/offboarding scenarios and other business processes reduce manual intervention to manage users.

→ Visual support

Workflow simulation

In order to test the business logic in advance or to analyze the effects of individual workflows, it is possible to execute the functionality in preview mode. This allows the potential effects to be checked in advance.

Process resumption

If a workflow fails or is stopped, the process can be restarted at a specific point to apply the remaining business logic.

Component extension

Any applications can be integrated through a powerful REST interface. Connections to Microsoft Entra Permission Management or to Microsoft Defender are thus easily possible.
